Improved prompt

Game Name: Corruption Hunter

Game Concept

Create a simple, playable 2D browser game called **Corruption Hunter**. The player is an anti-corruption investigator in a fictional country where corrupt politicians steal public money and prevent national development. The player's mission is to investigate the city, collect evidence, arrest corrupt politicians through a fair process, and use recovered public funds to develop the country.

1. Function

The player explores a city, investigates suspicious locations, talks to witnesses, collects evidence, identifies corrupt politicians, and submits evidence to the authorities. After successfully exposing corruption, the player chooses development projects and uses recovered public money to improve the city.

2. Win Condition

Win the game by:

- Collecting three important pieces of evidence.
- Identifying the correct corrupt politician.
- Submitting sufficient evidence to secure their arrest.
- Completing three development projects using recovered public funds.

After winning, display a clear success message and show the city transformed into a cleaner, safer, and more developed place.

3. Lose Condition

The player loses if the investigation timer reaches zero before enough evidence is collected, or if the player makes three incorrect accusations. Display a clear explanation and offer a restart button.

4. Controls

- **WASD or Arrow Keys:** Move the character.
- **E:** Interact with nearby people, evidence, and buildings.
- **Mouse click:** Select dialogue choices and development projects.
- **Restart button:** Start a new game after winning or losing.

Display the controls on the game screen so new players can understand them easily.

5. Boundaries

Create a top-down, 2D city map with roads, buildings, a government office, a construction site, a bank, and a public park. Keep the player inside the map. Prevent the character from walking through buildings and other solid objects. Clearly mark locations that can be investigated.

6. User Interface (UI)

Show these elements clearly:

- Game title and short mission instructions.
- Investigation timer.
- Evidence collected: 0/3.
- Number of incorrect accusations.
- Recovered public funds.
- Development projects completed: 0/3.
- Interaction instructions.
- A visible mission-completion message.

Use readable text, simple icons, and a clean layout. Make the game fit normal desktop and mobile browser screens as well as practical.

7. Scoring

- Collect valid evidence: +100 points per item.
- Correctly identify a corrupt politician: +300 points.
- Complete a development project: +200 points.
- Make an incorrect accusation: −150 points.
- Waste public funds: −100 points.

Display the total score throughout the game. Do not allow the score to fall below zero.

Additional Game Rules

1. Give the player three distinct evidence locations: a suspicious construction contract, a record of missing public funds, and a witness statement.
2. Require the player to collect all three pieces of evidence before accusing the politician.
3. Provide a clear confirmation step before submitting an accusation.
4. Once the arrest is successful, unlock the development phase.
5. Let the player choose three projects, such as repairing roads, improving a school, and building a healthcare facility.

6. Deduct the cost of each project from recovered public funds and prevent spending more money than is available.
7. Show visible changes to the city as projects are completed.
8. Keep the game educational but entertaining. Do not reward random accusations; reward investigation and evidence-based decisions.
9. Include a short introduction, clear instructions, and a restart option.
10. Use fictional names and locations.

Visual Design

Use a colorful, clean, top-down 2D style. At the beginning, show damaged roads, unfinished buildings, litter, and neglected public facilities. As the player completes development projects, replace these with repaired roads, improved buildings, greenery, and cleaner public spaces. Make the before-and-after transformation noticeable.

Technical Requirements

- Use HTML, CSS, and vanilla JavaScript.
- Put the entire game in one file named `corruption_hunter.html`.
- Do not require a server, external libraries, paid services, or API keys.
- Ensure the game runs on GitHub Pages.
- Implement working movement, collision detection, interactions, evidence collection, timer, scoring, accusation logic, project selection, win/lose states, and restart functionality.
- Do not include placeholder buttons or unfinished mechanics.
- Test the game logic for errors and ensure all required features work before providing the final code.
- Include brief instructions for publishing the game in my existing GitHub portfolio repository and linking it from my portfolio website.
